

Safely publishing your social network data: **The network anonymization problem**

Rachel de Jong, Mark van der Loo, **Frank Takes** — Leiden University
28 June 2025, Paris, France

Recommendations for Sharing Network Data and Materials

Neal, Z. P., Almqvist, Z. W., Bagrow, J., Clauset, A., Diesner, J., Lazega, E., Lovato, J., Moody, J., Peixoto, T. P., Steinert-Threlkeld, Z., and Teixeira, A. S. (2024). Recommendations for sharing network data and materials. *Network Science*, 12, 404-417. <https://doi.org/10.1017/nws.2024.16>

"Researchers should share the network data and materials necessary to reproduce reported results via a publicly accessible repository when an associated manuscript is published...but access to or use of shared data and materials may be restricted if necessary to avoid harm or comply with regulations" (p. 404).

This talk

Q1: How to **measure anonymity?**

Q2: How to **anonymize** a network?

Q3: What is the **utility** of the resulting network?

k-Anonymity

- Given a graph $G = (V, E)$,
 - a node is k -anonymous if it has $k-1$ **equivalent** nodes
 - a node is **not unique** if it is at least 2-anonymous
 - For this presentation, assume: not unique \rightarrow **anonymous**
- **Network uniqueness** $U(G)$ = fraction of unique nodes (1/9 in the graph below)

Anonymity measures

- Whether two nodes are **equivalent** is assessed by an **anonymity measure**
 - Anonymity measures of the **ego network** (distance 1) of the **focal node**:
 - Degree 2
 - Count ($|V|$, $|E|$) (3, 3)
 - Degree distribution {2, 2, 2}
 - Isomorphism 3a4b
 - Anonymity measures looking **slightly further** than **focal node** ego network:
 - **VRQ: degree of neighbors** {2, 3, 3}
 - Anonymity measures looking **further**:
 - All the **five** measures **above** at **distance 2**
 - Isomorphism at distance > 2 ca4b5e
- R.G. de Jong, M.P.J. van der Loo and F.W. Takes, The effect of distant connections on node anonymity in complex networks, *Scientific Reports* 14: 1156, 2024.

Anonymity measures

Same measures, all at distance 2

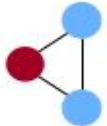

This talk

Q1: How to **measure** anonymity?

Q2: How to **anonymize a network?**

Q3: What is the **utility** of the resulting network?

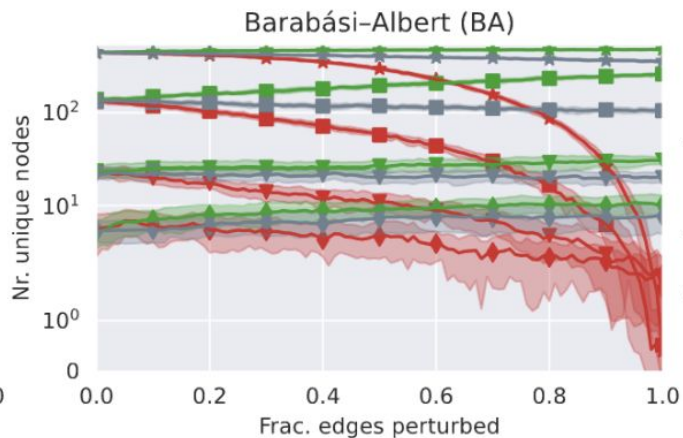

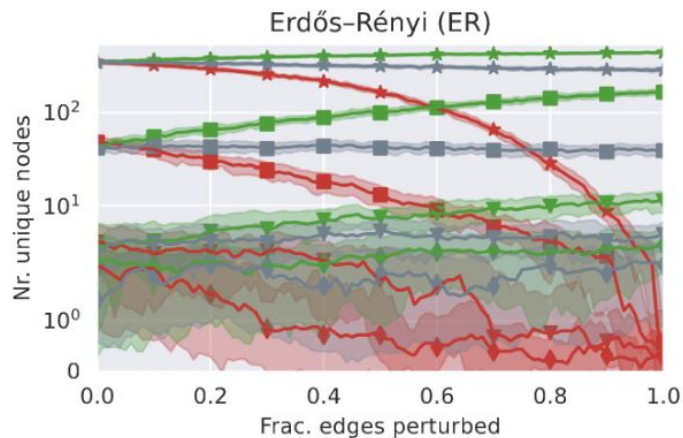

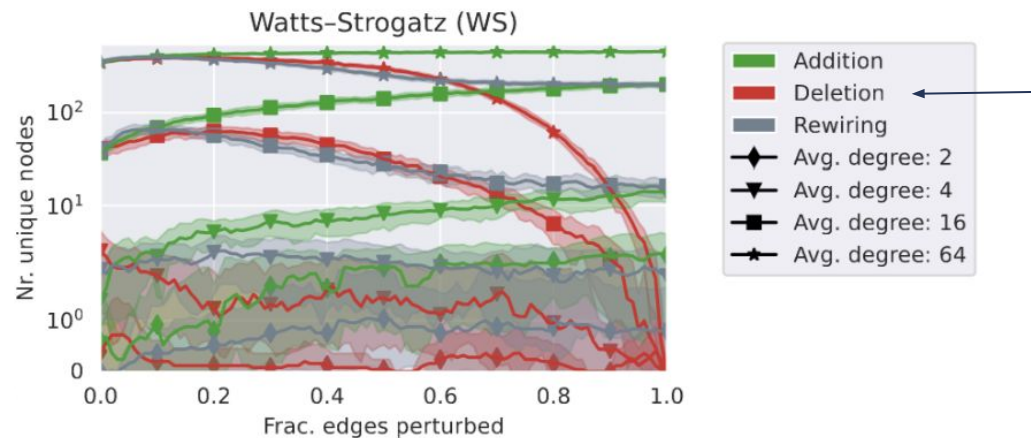

Network anonymization

- In the remainder on the anonymity measure **count** ($|V|$, $|E|$) (3, 3) 
- **Network anonymization problem:** given a network $G = (V, E)$, perturb the network to **maximize anonymity** $1 - U(G)$

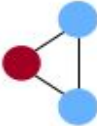

Alternatively: the **uniqueness minimization** problem, i.e., minimize $U(G)$

- How to **perturb** the network?

How to perturb the network?

Network anonymization

- In the remainder on the anonymity measure **count** ($|V|$, $|E|$) (3, 3) 
- **Network anonymization problem:** given a network $G = (V, E)$, perturb the network to **maximize anonymity** $1 - U(G)$

Alternatively: the **uniqueness minimization** problem, i.e., minimize $U(G)$

- Perturbation method: **edge deletion**
 - More sparse graph means fewer possible “states”, i.e., more anonymity
 - Mimics real-world attacker scenario of missing or unobserved links

Anonymization algorithms

- Random and local optimization/heuristic approaches (this presentation):
 - Random deletion (edge sampling)
 - Structure-based edge selection (e.g., based on degree)
 - Uniqueness-based edge-selection: select edges that **affect the largest number of unique nodes**, in an attempt to make them anonymous
- Global optimization (not in this presentation):
 - Genetic algorithms, see:
S. Bonello, R.G. de Jong, T.H.W. Baek, and F.W. Takes, Utility-aware social network anonymization using genetic algorithms, in *Proceedings of the 27th ACM Genetic and Evolutionary Computation Conference (GECCO)*, 2025.
 - Many other ideas that we are working on :-)
- Algorithm performance measured in terms of **fraction of edges preserved**

Anonymization algorithms

$|V|$: ~100 - 6,927 $|E|$: ~300 - 11,850

This talk

Q1: How to **measure** anonymity?

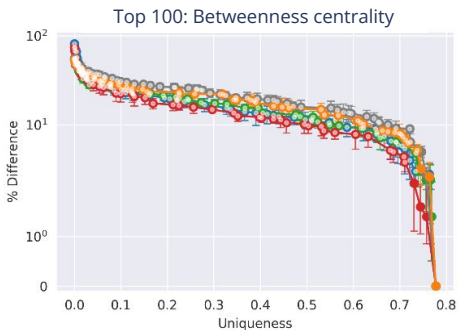

Q2: How to **anonymize** a network?

Q3: What is the **utility of the resulting network?**

Data utility

- **Data utility** in network anonymization: extent to which perturbed network remains usable for common network analysis tasks
 - **Edges retained** Straightforward measurement of utility
Literature: 5% missing edges is usually fine!
 - **Clustering coefficient** Percentage difference in average node clustering coefficient
 - **Average distance** Percentage difference in average distance in giant component
 - **Robustness** Fraction of nodes in the giant component
 - **Centrality** Percentage overlap of top-100 nodes based on betweenness
 - **Community structure** Similarity in terms of NMI of discovered communities
- **Privacy/utility** trade-off: balance between attained anonymity and data utility

Anonymity vs. utility: algorithms

Random

Structure based

Structure based

Uniqueness based

Uniqueness based

**Best algorithm
based on unique-
ness does not
affect trade-off!**

Anonymity vs. utility: measures

Degrees of neighbors

Isomorphism

Degree distribution

$(|V|, |E|)$

Degree

More strict measure

worse trade-off

Conclusions

- Network anonymization is an interesting, important problem
- To **measure** anonymity, look **further**, rather than precisely
- To **anonymize** a network heuristically, non-random targeting of edges between unique nodes results in
 - higher **anonymity** than random targeting and
 - equal or higher **data utility**
- Future work includes utility-aware optimization, applications to population-scale network data, and better algorithms

Supplementary slides

Anonymity measures at distance 2

Isomorphism as anonymity measure

Isomorphism as anonymity measure

d - k -Anonymity

d - k -Anonymity

■ $d=1 \rightarrow d=5$

□ $d=1$ is not enough

□ After $d=2$ often not much change

■ $k=1 \rightarrow k=5$

□ Average: +0.06

□ For some networks larger effect

■ Focus on:

□ 2-neighborhood

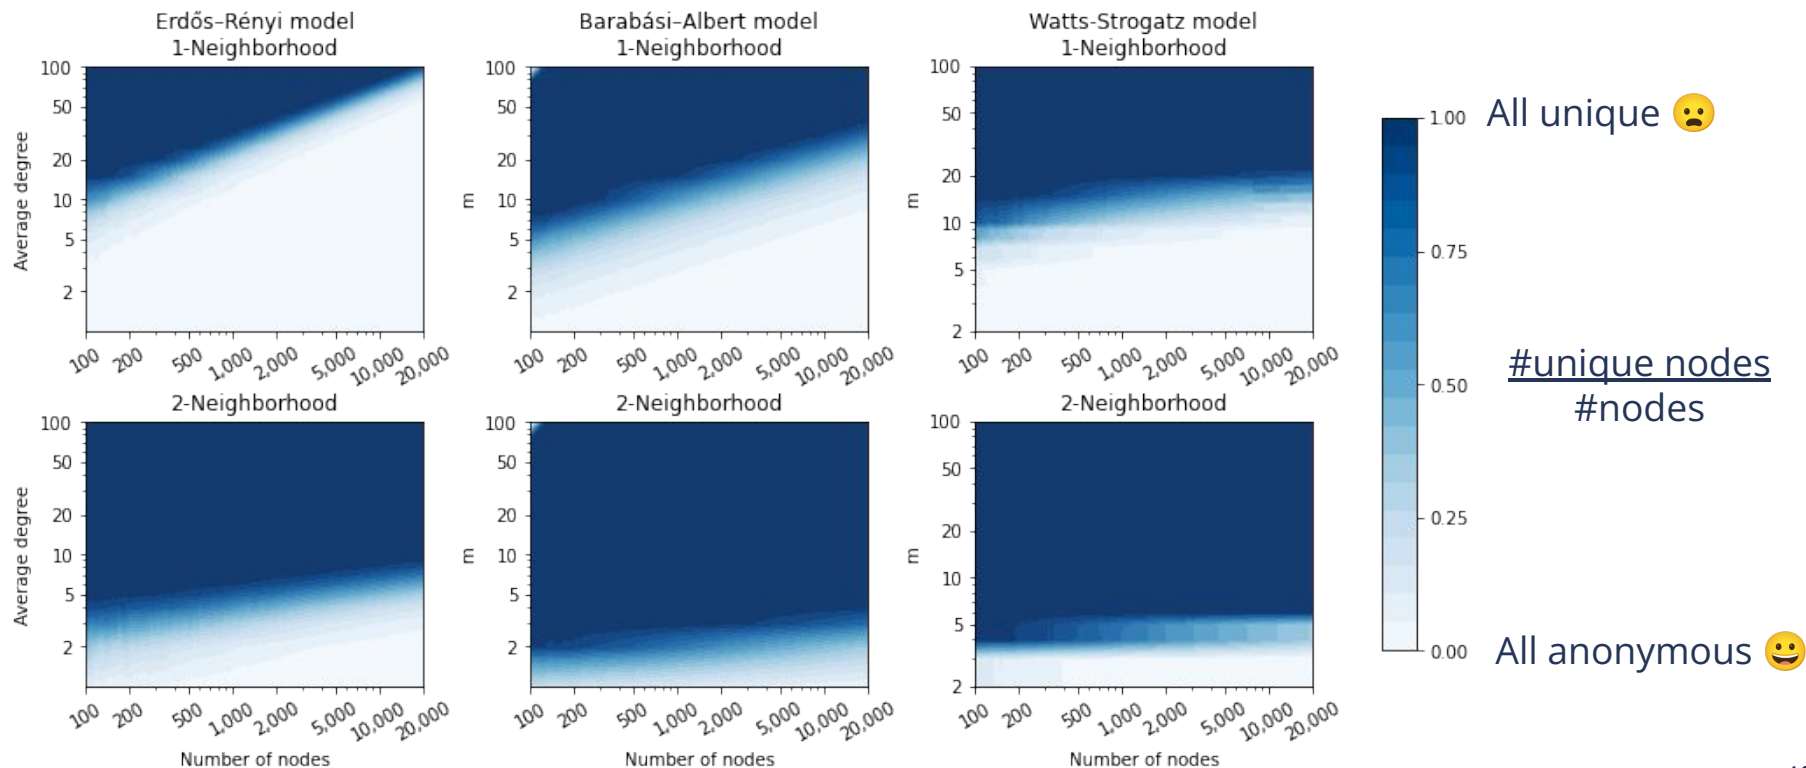

□ Uniqueness ($k=1$)

Cascading effect per level

d - k -Anonymity on graph models

Almost no anonymity for $d=2$. Size has small / no effect

Impossible to anonymize?

Measures: strictness

More edges \rightarrow less anonymity

More "spread" network \rightarrow more anonymity

Anonymity-cascade
